DID YOU KNOW ABOUT REGENERATIVE AGRICULTURE?

This model proposes a global vision of coffeechain systems from a transformation of the relationship between the ecosystem and the resources, being an alternative that integrates into agriculture, forestry, and ecology. This model comes up with synergy between crops, animals, forests, and people.

THROUGH THE KNOWLEDGE OF THE AGROSYSTEMS CHARACTERISTICS

and the re-creation of natural patterns and processes, the model proposes the recovery of the soil through a compilation of practices that promote the accumulation of organic substance, increase fertility, water retention, and the CO2 proper cycle.

RENEWING, IMPROVING, AND RESTORING THE ORGANIC LAYER OF THE SOIL,

which is essential for life on Earth, allows millions of microorganisms, fungi, and insects to transform elements into nutrients that can be assimilated by plants, allowing us to consume healthy and nutritious food.

HOLISTIC REGENERATIVE DESIGN IS COMMITTED TO CLIMATE-SMART AGRICULTURE

that reduces the negative social and environmental impacts of food production, promoting the well-being of ecosystems and their associated services by improving nutrient and water cycling. It also provides local populations with the capacity to adapt to climate change and reduce their vulnerability.
